POLLEN MORPHOLOGY OF *Ebenus* L. (*Leguminosae*; SUBFAMILY *Papilionoideae*) IN TURKEY

N.M. PINAR, C. VURAL* AND Z. AYTAÇ*

*Department of Biology, Faculty of Science, Ankara University, 06100, Ankara Turkey.

Abstract

Pollen grains of 12 species and 3 varieties of the genus *Ebenus* L. (*Leguminosae*, subfamily *Papilionoideae*) have been examined using light microscopy (LM) and scanning electron microscopy (SEM). Pollen description of each taxon has been given. Pollen grains of *Ebenus* L. species examined are radially symmetrical, isopolar, tricolpate, prolate rarely perprolate. Their ornamentations are reticulate. The exine structure are similar, ectexine thicker than endexine. The pollen morphology seems to be very similar to each other.

Introduction

*Leguminosae* in the flora of Turkey is the second largest family on the basis of species diversity after *Compositae* (Davis, 1988). The genus *Ebenus* L., has 20 species in the world of which 14 are endemic in Turkey. The genus *Ebenus* in Turkey has 14 species, 3 varieties with a total of 17 taxa where 9 taxa are Irano-Turanian and 8 taxa are East Mediterranean (Davis, 1970).

Pollen morphology of *Ebenus* has received little attention. Perveen & Qaiser (1998) studied *Ebenus stella* Boiss., under the LM and SEM and made a comparison between other pollen morphology of *Leguminosae* species. They defined 10 main pollen types for the family *Leguminosae* viz., *Alysicarpus monilfer* 1-type, *Astragalus affghanus* type, *Colutea armata* type, *Dunisia villosa* 1-type, *Ebenus stellata* type, *Onobrychis stewartii* type, *Rhynchosia minima* 1-type, *Securigera securidaca* type, *Tavernieria lappacea* type and *Vigna triloba* type. They placed *Ebenus stella* Boiss., in the *E. stella* type. The present report gives a detailed account of the pollen morphology of Turkish *Ebenus* species by light and electron microscopy.

Materials and Methods

Polleniferous material was taken from Gazi University Herbarium (GAZI) collected by Z. Aytaç. For LM study, the pollen slides were prepared according to the technique of Wodehouse (1935). An Olympus B2-2 microscope was used for examination.

For SEM study, dry pollen grains were transferred to stubs and coated with gold. A Jeol 106 CXII scanning electron microscope was used. The terminology used is mainly that of Faegri & Iversen (1975).
Results

Pollen descriptions

Ebenus plumosa Boiss., & Ball. var. plumosa (Fig. 1a-c)

Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 30.4 µm in polar diameter, 16.2 µm in equatorial diameter. AMB subcircular, 17.1 µm in diameter. Ornamentation reticulate; with ± irregular pattern of muri, luminae 0.1-0.45 µm in diameter. The diameter of luminae is narrow to colpus. Exine 1 µm thick. Ektexine thicker than endexine. Intine 0.5 µm thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 1.3 µm in diameter.

E. plumosa var. speciosa Hub. Mor.

Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 33.5 µm in polar diameter, 18.7 µm in equatorial diameter. AMB subcircular; 19.6 µm in diameter. Ornamentation reticulate; with ± irregular pattern of muri, luminae 0.1-0.35 µm in diameter. The diameter of luminae is narrow to colpus. Exine 1 µm thick. Ektexine thicker than endexine. Intine 0.5 µm thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 1.3 µm in diameter.

E. macrophylla Jaub & Spach (Fig. 2a)

Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 28.3 µm in polar diameter, 16.8 µm in equatorial diameter. AMB subcircular; 17.2 µm in diameter. Ornamentation reticulate; with ± irregular pattern of muri, luminae 0.1-0.3 µm in length. The diameter of lumen is narrow to colpus. Exine 1 µm thick. Ektexine thicker than endexine. Intine 0.5 µm thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 3.8 µm in diameter.

E. barbigera Boiss (Fig. 1d-f)

Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 24.6 µm in polar length, 17.3 µm in equatorial diameter. AMB subcircular; 17.5 µm in diameter. Ornamentation reticulate; with ± irregular pattern of muri, luminae 0.1-0.3 µm in diameter. The diameter of luminae is narrow to colpus. Exine 1 µm thick. Ektexine thicker than endexine. Intine 0.5 µm thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 1.7 µm in diameter.

E. reesei Hub-Mor. var. reesei (Fig. 1i-k)

Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 36.5 µm in polar length, 16.3 µm in equatorial diameter. AMB subcircular; 17.2 µm in diameter. Ornamentation reticulate; with ± irregular pattern of muri, luminae 0.03-0.25 µm in diameter. The diameter of luminae is narrow to colpus. Exine 1 µm thick. Ektexine thicker than endexine. Intine 0.5 µm thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 2.8 µm in diameter.

E. reesei Hub-Mor. var. minor

Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 27.9 µm in polar diameter, 18 µm in equatorial diameter. AMB subcircular; 18.5 µm in diameter. Ornamentation reticulate; with ± irregular pattern of muri, luminae 0.1-0.4 µm in diameter. The diameter of luminae is narrow to colpus. Exine 1 µm thick. Ektexine thicker than endexine. Intine 0.5 µm thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 3.5 µm in diameter.

E. haussneckthii Bornn. eq Hub.-Mor.
Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 29.1 μm in polar diameter, 17.7 μm in equatorial diameter. AMB subcircular, 18.4 μm. Ornamentation reticulate; with ± irregular pattern of muri, luminae 0.05-0.25 μm in diameter. The diameter of luminae is narrow to colpus. Exine 1 μm thick. Ektexine thicker than endexine. Intine 0.5 μm thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 3.1 μm in diameter.

E. depressa Boiss. & Bal.
Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 27.8 μm in polar length, 17.2 μm in equatorial diameter. AMB subcircular; 18.7 μm. Ornamentation reticulate; with ± irregular pattern of muri, luminae 0.1-0.5 μm in diameter. The diameter of luminae is narrow to colpus. Exine 1 μm thick. Ektexine thicker than endexine. Intine 0.5 μm thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 2.3 μm in diameter.

E. bourgaei Boiss. (Fig. 1g-i, 2b)
Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 28.8 μm in polar length, 16.8 μm in equatorial diameter. AMB subcircular; 18.7 μm. Ornamentation reticulate; with ± irregular pattern of muri, luminae 0.15-0.45 μm in diameter. The diameter of luminae is narrow to colpus. Exine 1 μm thick. Ektexine thicker than endexine. Intine 0.5 μm thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 3.6 μm in diameter.

E. cappodocica Hauss. & Siehe (Fig. 1j-k, 2c)
Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 25.2 μm in polar length, 17.8 μm in equatorial diameter. AMB subcircular; 19 μm. Ornamentation reticulate; with ± irregular pattern of muri, luminae 0.05-0.25 μm in diameter. The diameter of luminae is narrow to colpus. Exine 1 μm thick. Ektexine thicker than endexine. Intine 0.5 μm thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 2.3 μm in diameter.

E. boissieri Barbey (Fig. 1l-n, 2e)
Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 35.8 μm in polar length, 17.7 μm in equatorial diameter. AMB subcircular; 16.8 μm. Ornamentation reticulate; with ± irregular pattern of muri, luminae 0.1-0.35 μm in diameter. The diameter of luminae is narrow to colpus. Exine 1 μm thick. Ektexine thicker than endexine. Intine 0.5 μm thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 3.9 μm in diameter.

E. hirsuta Jaub. & Spach (Fig. 2f)
Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 30.3 μm in polar length, 17.7 μm in equatorial diameter. AMB subcircular; 18.3 μm. Ornamentation reticulate; with ± irregular pattern of muri, luminae 0.1-0.45 μm in diameter. The diameter of luminae is narrow to colpus. Exine 1 μm thick. Ektexine thicker than endexine. Intine 0.5 μm thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 0.66 μm in diameter.
**E. laguroides** Boiss. var. (Fig. 2g)

Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 31.8 \( \mu m \) in polar length, 18.8 \( \mu m \) in equatorial diameter. AMB subcircular; 18.3 \( \mu m \). Ornamentation reticulate; with \( \pm \) irregular pattern of muri, luminae 0.05-0.4 \( \mu m \) in diameter. The diameter of luminae is narrow to colpus. Exine 1 \( \mu m \) thick. Ektexine thicker than endexine. Intine 0.5 \( \mu m \) thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 0.9 \( \mu m \) in diameter.

**E. laguroides** (Boiss.) Bornm. var. ciliicica (Fig. 1o-r, 2h)

Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 28.8 \( \mu m \) in polar length, 16.7 \( \mu m \) in equatorial diameter. AMB subcircular; 17.4 \( \mu m \). Ornamentation reticulae; with \( \pm \) irregular pattern of muri, luminae 0.05-0.2 \( \mu m \) in diameter. The diameter of luminae is narrow to colpus. Exine 1 \( \mu m \) thick. Ektexine thicker than endexine. Intine 0.5 \( \mu m \) thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 3.8 \( \mu m \) in diameter.

**E. pisdica** Hub-Mor. (Fig. 2i)

Pollen grains radially symmetrical, isopolar, tricolpate, prolate; 32.1 \( \mu m \) in polar length, 18.8 \( \mu m \) in equatorial diameter. AMB subcircular; 19.2 \( \mu m \). Ornamentation reticulate; with \( \pm \) irregular pattern of muri, luminae 0.1-0.4 \( \mu m \) in diameter. The diameter of luminae is narrow to colpus. Exine 1 \( \mu m \) thick. Ektexine thicker than endexine. Intine 0.5 \( \mu m \) thick. The colpus long, ends acute and margin even; membrane sub-psilate, operculate. Apocolpium 3.2 \( \mu m \) in diameter.

**Discussion**

Pollen grains of *Ebenus* L. species examined are radially symmetrical, isopolar and tricolpate. The shape is commonly prolate or less commonly to perprolate. Only *E. boissieri* has a perprolate pollen shape and by this peculiarity, it can be easily separated from other species. Colpal membrane sub-psilate. The ektexine is thicker than endexine. A reticulate iectum type is common (Table 1). The delimitation of this genus on the basis of pollen characters is difficult.

This study has revealed that the species of *Ebenus* should be placed in the *Ebenus stellata* type of Parveen & Qaiser (1998) on the basis of their colpate, with prolate pollen shape. *Ebenus* species are also similar to *Onobrychis stewartii* type (tricolpate grains with a reticulate tectum). *O. stewartii* type is recognized by its preprolate P/E ratio from *Ebenus*. Only *E. boissieri* has preprolate pollen shape. *E. boissieri* should therefore be placed in the *O. stewartii* type.

The *Ebenus* genus has colpate peculiarity according to Guinet & Ferguson (1989) where in the *Leguminosae* family phylogenetic diagram it is shown as advanced character. All the taxa of the genus *Ebenus* which were examined appear to be very similar.
